INVITED SPEAKER: SCOTT WILLIAMSON SPEAKER SERIES
Maria E. Orive
See page 10 for biography.

Mathematical Models in Evolutionary Research
Nautilus 5 • Evolution • Special Speaker • GA
Mathematical models provide powerful tools for investigating the incredibly diverse range of life histories displayed by living organisms and how these life history complexities shape populations and species. Importantly, the form and frequency of reproduction, the manner of dispersal across space and time, and the type of within-population structure all strongly impact evolutionary patterns and processes. Mathematical models are useful abstractions of important population processes, and Dr. Orive will discuss how developing a model can help clarify the important aspects of a biological process, for both teaching and in basic research. She will also present an example from her own research, where two different types of mathematical models are combined (a quantitative genetics model and a matrix model of population demography) to consider how different types of reproduction affect a population’s ability to respond to environmental change.
We are proud to feature Dr. Orive as part of the Scott Williamson Speaker Series. The series was established in 2017 by Brad and Carol Williamson to honor their son Scott, a gifted biologist who loved the challenge of the big questions in biology.
